

Executive Summary

Coffee Shop Sales Analysis

Jan–Jun 2023 · 3 stores · New York

Objective & Scope

This analysis examines sales performance across three coffee shop locations in New York (Astoria, Hell's Kitchen, Lower Manhattan) between January and June 2023, covering **~149,000 transactions** and **\$698.8K** in total revenue. The goal was to identify growth drivers, product performance, and operational patterns to support data-driven business decisions.

Approach

Data was cleaned and explored in Excel, validated through SQL queries, and consolidated into an interactive Power BI dashboard covering revenue trends, product performance, time-based demand, and store comparisons.

Key Findings

- Revenue grew steadily across the period, from **\$82K** in January to **\$166K** in June (+102%), with the strongest month-over-month increase in May (+32%).
- The top 4 products account for **44%** of total revenue, with Barista Espresso alone contributing **13%** — indicating meaningful product concentration.
- 10am** is the peak revenue hour, generating nearly twice the average hourly revenue.
- Weekday revenue is evenly distributed, with Monday and Friday slightly leading and Saturday recording the lowest volume.
- All three stores perform at a comparable level (**~\$230–236K each**) and grow at a similar pace, with no location significantly outperforming the others.

Recommendations

- Staffing & inventory:** Align staffing levels and stock replenishment with the 10am demand peak to reduce wait times and avoid lost sales.
- Product strategy:** Given the revenue concentration in a small set of products, consider targeted promotions for mid-tier products to diversify the revenue base and reduce dependency on top performers.
- Cross-store learning:** Since performance is consistent across locations, operational practices are likely transferable between stores — a useful basis for shared best practices rather than isolated store-level fixes.
- Continued growth monitoring:** With revenue on a clear upward trend, ensure supply chain and staffing capacity scale accordingly to sustain growth into the second half of the year.

Business Impact & Next Steps

These insights support more efficient staffing schedules, targeted product promotions, and consistent operational standards across locations. Future analysis could extend this work with customer segmentation, demand forecasting, and price elasticity testing to further optimize revenue and margins.
